Week 9 – Debugging Assignment

IT202 – Class Participation

1. Line 1 – PHP Opening Tag

The PHP opening tag is written incorrectly. It should have a question mark after the less-than sign.

Fix: Change <php to <?php.

2. Line 2 – Require Statement

The file name doesn't have quotation marks around it, and there's also a missing semicolon.

Fix: require("connect.php");

3. Line 3 – Comment Error

The comment starts with only one slash, which isn't the correct format for a PHP comment.

Fix: Add another slash so it starts with //.

4. Line 5 – Variable and Parenthesis Error

The variable is written as $Name instead of $name. PHP is case-sensitive, so they aren't the same. There's also a missing closing parenthesis.

Fix: if (isset($name))

5. Line 7 – SQL Table Name

The table name has a space in it, so it needs to be written properly using backticks.

Fix: Use `Client Table` in the SQL query.

6. Line 8 – Missing Semicolon

The SQL query statement doesn't have a semicolon at the end.

Fix: $result = mysqli_query$(con, $sql);

7. Line 9 – Wrong Function

The code uses mysql_num_rows(), but since we're using MySQLi, the function needs to match.

Fix: $rows = mysqli_num_rows($result);

8. Line 10 – Wrong Operator

The code uses one equal sign, which is for assigning values. Since we're checking whether the number of rows equals 1, we need two equal signs.

Fix: if ($rows == 1)

9. Line 12 – Missing Dollar Sign

The variable name is missing the dollar sign.

Fix: echo $name;

10. Line 14 – Missing Closing Bracket

The code is missing a closing curly bracket for the first if statement.

Fix: Add another } before ?>.

Conclusion

After going through the code, I found mistakes involving PHP syntax, missing semicolons, variable names, and SQL functions. I listed each issue and how I would correct it so the code can run properly.
